ABSTRACT

A 1988 study that examined the economic performance of 22,091 graduates in 1984 of 14 vocational programs in Ohio used federal income tax records. Twelve of the programs with 20,557 graduates were at the secondary level, and 2 with 1,534 graduates were at the associate level. The incomes of vocational graduates were compared to income of equivalent groups in the general population. The study also investigated the geographic mobility of vocational graduates since 1979. Results showed predominantly higher incomes for vocational graduates than for the general population. The result varied by vocational program, but the ratios were higher than 1 for the 1979 graduates in all programs. The income advantage ranged from 5 to 85 percent for graduates of secondary programs and from 12 to 68 percent for graduates of associate programs. (An executive summary and 51 tables and diagrams are provided.) (YLB)

Executive Summary

Ohio University
Athens, Ohio 45701
1993

The economic performance of graduates of vocational programs is a primary factor in the evaluation of vocational education. This study evaluates the performance of students who completed state-funded vocational job-training programs in Ohio.

The study uses an original source of information — federal income tax records. The data were provided in batch form by the Internal Revenue Service from its Information Returns Master File in full compliance with the strict requirements regarding disclosure of personal information.

This study examines the performance in 1988 of 22,091 graduates in 1984 of fourteen vocational programs. Twelve of the programs with 20,557 graduates were at the secondary level, and two with 1,534 graduates at the associate (second-year college) level.

The incomes of vocational graduates were compared to those in the general population at the same age bracket, educational achievement and geographical location. Data on the equivalent groups in the general population were based on Bureau of the Census, Current Population Survey and Survey and Regional Population and Per Capita Estimates for Counties and Incorporated Places.

The results of the study indicate predominately higher incomes of vocational graduates than others in the general population who are of the same age bracket and years of schooling, i.e. 18-24 years old and 4 years of high school for Secondary Vocational graduates, and 25-34 years old and 1-3 years of college for Associate Vocational graduates.

The following tables and the corresponding graphs show the ratio in 1988 of the average income earned by 1984 vocational graduates to the average income of the equivalent group. The ratios for graduates of all secondary and associate programs are higher than 1. The income advantage ranges from 5% to 85% for graduates of secondary programs and 12% and 68% for graduates of associate programs.

The research project reported herein was performed pursuant to agreement with the Ohio Department of Education's Division of Vocational and Career Education. Contractors undertaking such projects under government sponsorship are encouraged to express freely their professional judgment in the conduct of the project. This research does not necessarily represent official positions of the Ohio Department of Education.

Ted Sanders
Superintendent of Public Instruction
State of Ohio

It is the policy of the Ohio Department of Education, Division of Vocational and Career Education, that educational activities, employment, programs, and services are offered without regard to race, color, national origin, sex, religion, handicap, or age.

PREFACE

The purpose of this study is to evaluate vocational education by examining the economic performance of vocational graduates. In its measurement of this performance, the study uses an original source of information — federal income tax records. The Internal Revenue Service provided the data in batch form in full compliance with the strict requirements for protection of personal information.

I am deeply indebted to many individuals and organizations for their assistance and cooperation in the design and implementation of this study. At the Internal Revenue Service, Dr. Fritz Scheuren, Director, Statistics of Income Division lent his gracious support and encouragement to the research effort. Mr. Peter Sailer provided encouragement, valuable coordination and advice. Ms. Dodie Riley was a source of insightful advice, unfailing support, effectiveness and genuine interest in the project. Ms. Cathy Katz and Mr. Ray Salen organized and processed the data with ability and dedication.

Dr. Darrell L. Parks, Director, Vocational and Career Education, Ohio Department of Education gave his persistent and keen support to the research project. Dr. G. James Pinchak, Associate Director, was a valuable source of encouragement, judicious coordination and advice at different stages of the research.

Mr. David Sarchet served very ably in computer programming and data processing. Mr. Matloob Piracha performed important data processing and research assistance. Ms. Elisha Nuzum and Ms. Catherine Kupec provided capable and dedicated research assistance. Ms. Shahida Abubakar, Ms. Sri A. Abubakar, Mr. Nanda J. Karanaganda, Ms. Wai Man Wong, Mr. Naiying Yu, Mr. Zhang Yu, and Ms. Xiu-Zhen Zhao performed effective data processing and research assistance. Ms. Beth Marino did typing and graphics skillfully and with genuine dedication. Mr. Rob Painter provided valuable assistance including graphic map design. Mrs. Becky Huff performed the task of processing, typing and related graphics. She did so with high ability, patience, and dedication.

CHAPTER I

INTRODUCTION

CHAPTER I

INTRODUCTION

Vocational education, as all forms of education, has a multi-dimensional effect on the welfare of individuals and society. Determination of the economic performance of graduates of vocational programs is essential to the process of decision making over the allocation of a given set of scarce resources among numerous competing uses.

Studies of the economic performance of vocational education graduates generally rely on earnings and related data gathered through personal surveys. Such follow-up studies have a number of limitations:

1. small percentage of returns in the form of completed questionnaires,
2. doubt about the randomness of returns, i.e. that they represent a random sample of the surveyed population,
3. doubt about the accuracy of information provided, partly because the individuals surveyed may not have the information readily available in the form sought by investigators. Particularly in the case of income earned over a full year (let alone various categories of income), the data obtained could suffer from significant inaccuracies.

In its measurement of the economic performance of graduates of vocational programs, this study uses an original source of information — federal income tax records. The federal income tax source avoids a number of limitations associated with follow-up studies utilizing questionnaires. The tax data records are standardized by type of income and by period (tax year), and do not rely on the memory nor the selectivity of individual responses to questionnaires. The data were provided in batch form by the Internal Revenue Service from its Information Returns Master File in full compliance with the strict requirements regarding disclosure of personal information.

Methodology

The study seeks to measure the economic performance in 1988 of 22,091 graduates in 1984 of fourteen vocational programs in Ohio. Twelve of the programs with 20,557 graduates were secondary vocational programs. A total of 1,534 graduated from two associate programs.

Each of the vocational graduates was identified by social security number and the code of the vocational program completed. Furthermore, each of the graduates was identified by the school attended. The school location was then used to group trainees by geographical region. The State of Ohio was divided into five regions: Central, Northeast, Northwest, Southwest, and Balance of Ohio. The first four regions contain only metropolitan statistical areas. The Central Region included the Columbus Metropolitan Statistical Area (MSA); the Northeast Region: the Akron Primary Metropolitan Statistical Area (PMSA), the Canton MSA, the Cleveland PMSA, the Lorain-Elyria PMSA, Jefferson County in the Steubenville-Weirton MSA, and the Youngstown-Warren MSA. The Northwest Region included the Lima MSA and Toledo MSA, while the Southwest Region was comprised of Clermont, Hamilton and Warren counties in the Cincinnati PMSA, and the Dayton-Springfield MSA. The region "Balance of Ohio" included Mansfield MSA, Washington county in the Parkersburg-Marietta MSA, as well as all non-MSA counties in the State of Ohio. Table I-A lists these regions by component counties. Diagram I-B shows the five Ohio regions on a state map.

Under a negotiated agreement with the Internal Revenue Service, the Statistics of Income Division of IRS was provided on a magnetic tape with a list of social security numbers in sequence of the vocational education graduates coded by vocational program attended. In addition, the Internal Revenue Service was furnished on hard copy with a list of all zip codes included in each of the five Ohio geographic regions. The list was developed using the following source materials:

1. Bureau of the Budget, Office of Management and Budget, Standard Metropolitan Statistical Areas: Titles and Definitions, 1983, 1984, 1985, 1986, 1987 and 1988,
2. National Technical Information Service, U.S. Department of Commerce, Five-Digit Zip Code Area Data (from 1983, 1984, 1985, 1986, 1987 and 1988 returns), Area four, Codes 43000 through 45899,
3. U.S. Postal Service, Map: National Service Area 4 (including Ohio) showing 3-Digit Zip Code Boundaries.

The Internal Revenue Service utilized its Information Returns Master File to prepare data on the vocational education graduates. A completed table was provided by IRS for each vocational program, in each of the five Ohio regions as well as in a sixth (outside Ohio) region.

TABLE I-A
LIST OF STATE GEOGRAPHIC REGIONS

The State of Ohio was divided into five geographic regions. Four of the regions (Central, Northeast, Northwest, and Southwest) contain only metropolitan statistical areas. The fifth region, Balance of Ohio, includes the Mansfield MSA and Washington County of the Parkersburg-Marietta MSA, as well as all non-MSA counties in the State of Ohio.

The components of each of the regions are listed below:

1. CENTRAL OHIO

Columbus MSA (Delaware, Fairfield, Franklin, Licking, Madison, Pickaway, and Union counties)

2. NORTHEAST OHIO

Akron PMSA (Portage and Summit counties)
Canton MSA (Carroll and Stark counties)
Cleveland PMSA (Cuyahoga, Geauga, Lake, and Medina counties)
Lorain-Elyria PMSA (Loraine county)
Steubenville-Weirton MSA (Jefferson county)
Youngstown-Warren MSA (Mahoning and Trumbull counties)

3. NORTHWEST OHIO

Lima MSA (Allen and Auglaize counties)
Toledo MSA (Fulton, Lucas, and Wood counties)

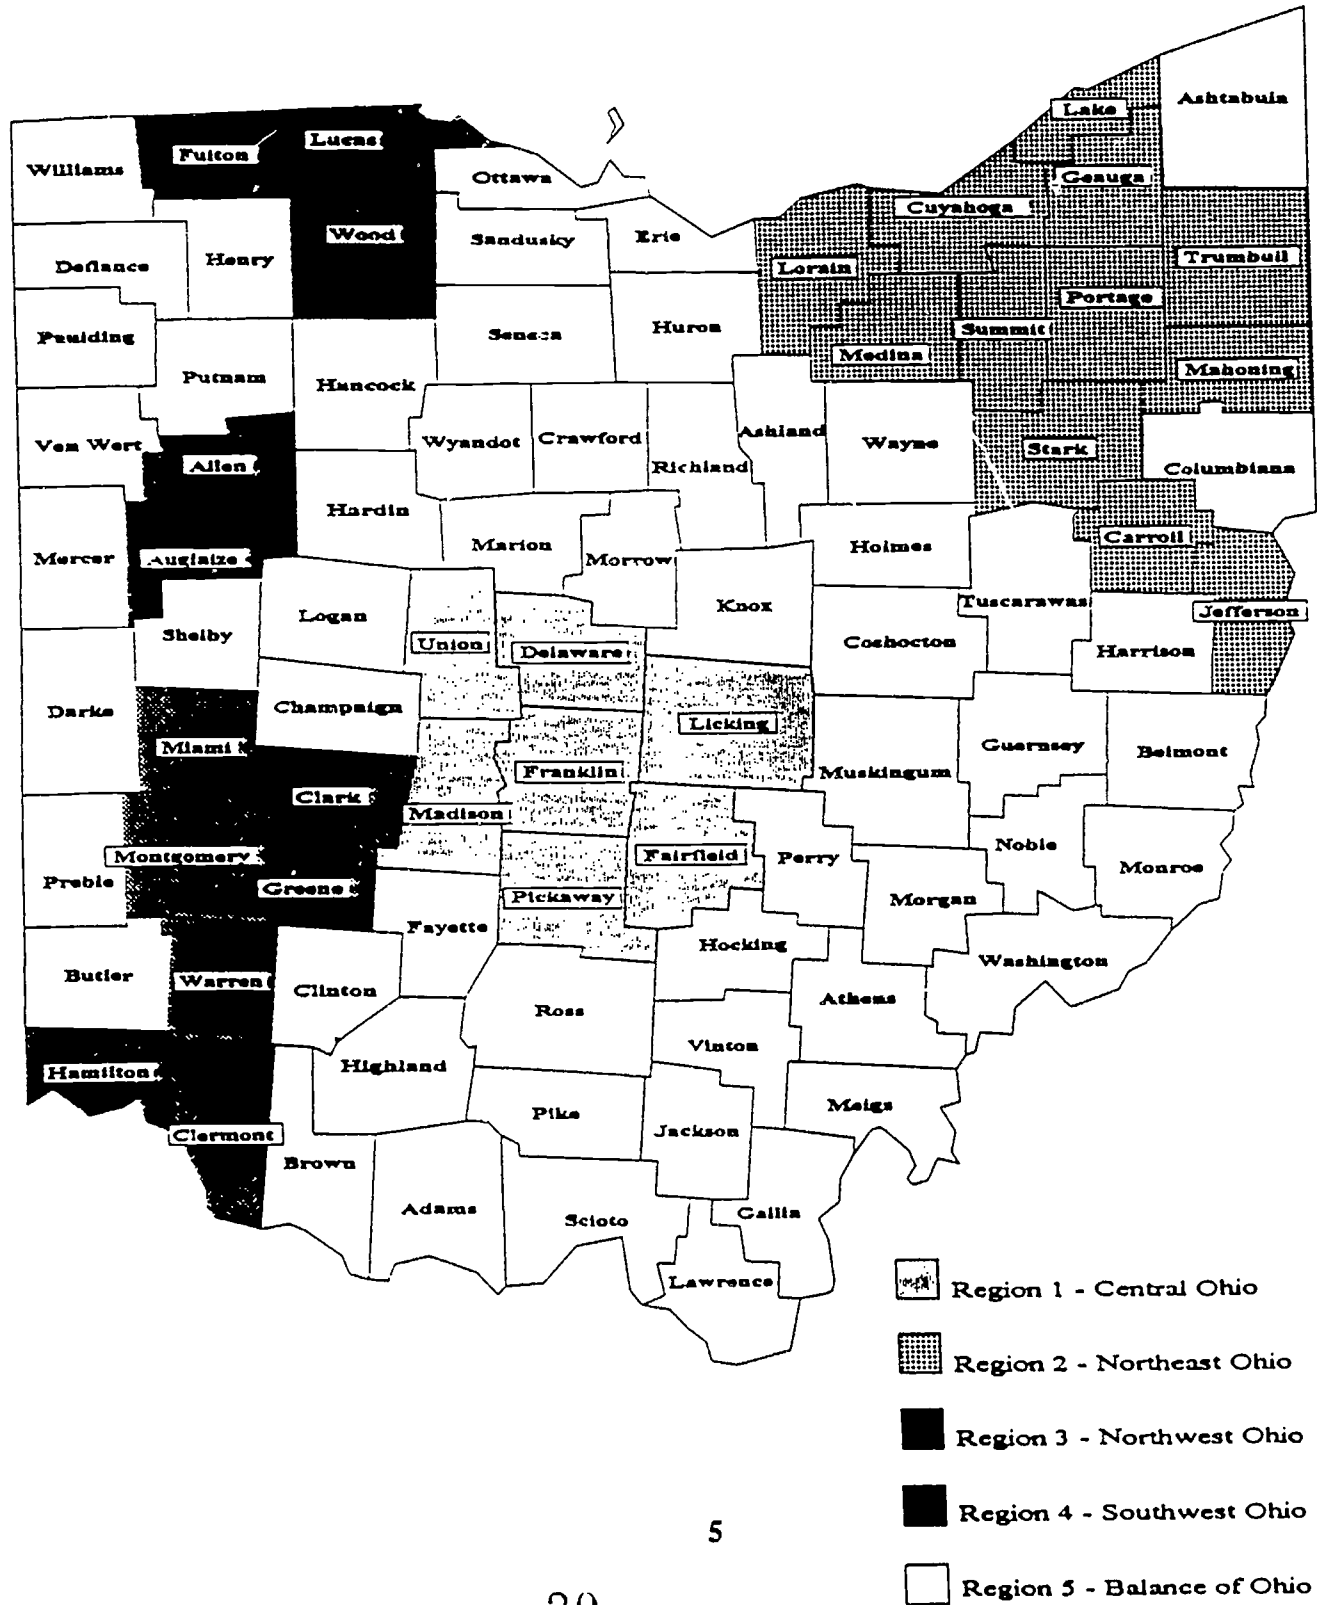

4. SOUTHWEST OHIO

Cincinnati PMSA (Clermont, Hamilton, Warren counties)
Dayton-Springfield MSA (Clark, Greene, Miami, and Montgomery counties)

5. BALANCE OF OHIO

Mansfield MSA (Richland county)
Parkersburg-Marietta MSA (Washington county)
All Non-MSA Counties: Adams, Ashland, Ashtabula, Athens, Belmont, Brown, Butler, Champaign, Clinton, Columbiana, Coshocton, Crawford, Darke, Defiance, Erie, Fayette, Gallia, Guernsey, Hancock, Hardin, Harrison, Henry, Highland, Hocking, Holmes, Huron, Jackson, Knox, Lawrence, Logan, Marion, Meigs, Mercer, Monroe, Morgan, Morrow, Muskingum, Noble, Ottawa, Paulding, Perry, Pike, Preble, Putnam, Ross, Sandusky, Scioto, Seneca, Shelby, Tuscarawas, Van Wert, Vinton, Wayne, Williams, and Wyandot.

Diagram I-B
State Geographic Regions

The latter region included those among the vocational graduates who were identified as non-Ohio residents, since their listed zip codes were not among those identifying the five Ohio regions.

The IRS Statistics of Income Division reviewed all tables to assure that no cell contained data on less than 10 individuals, in compliance with disclosure requirements. When necessary, data cells were combined. Furthermore, all tables were scrutinized and cleared by the IRS Disclosure Division before their release.

In Chapter II, we will report on and analyze the earnings and geographic mobility of the 1984 Secondary Vocational graduates in 1988, four years following their graduation. Chapter III will deal with the income and geographic mobility of the two associate vocational programs. In each of these, the performance in 1988 of the 1984 vocational graduates will be compared with that of the 1983, 1982, 1981 and 1980 vocational graduates in 1987, 1986, 1985 and 1984, respectively. The same data base, vocational programs and analytical techniques were used for the five chronological groups of vocational graduates.

The final chapter, Chapter IV, presents a summary of the findings, conclusions and recommendations.

CHAPTER II

**THE 1984 SECONDARY
VOCATIONAL EDUCATION
GRADUATES**

CHAPTER II

THE 1984 SECONDARY VOCATIONAL EDUCATION GRADUATES

The study included 20,557 graduates in 1984 of twelve secondary vocational programs in Ohio. In this chapter, we will report on and analyze the earnings and geographic mobility of the 1984 Secondary Vocational graduates in 1988, four years following their graduation. The performance in 1988 of the 1984 Secondary Vocational graduates will be compared with that of the 1983, 1982, 1981 and 1980 Secondary Vocational graduates in 1987, 1986, 1985 and 1984, respectively.

Table II-A lists the secondary vocational programs included in the study, the number of graduates, and the percentage of females and males in each program. Diagram II-B is a bar chart of the number of completers in each of the study's twelve secondary vocational programs. Diagram II-C shows the percentage of females and males in each of the study programs, while Diagram II-D and Diagram II-E compare these figures to those of the 1983, 1982, 1981 and 1980 vocational education graduates included in the earlier studies. Table II-F presents the distribution of the 1984 Secondary Vocational education graduates by vocational program and geographical training region.

A. INCOME OF 1984 SECONDARY VOCATIONAL GRADUATES: 1988 INCOME TABULATIONS

The data provided by the Internal Revenue Service were used to determine the economic performance of the 1984 Secondary Vocational graduates four years following their graduation.

Tables IIA-1 through IIA-12 present data on the 1988 Tax Year reported income of the 1984 vocational graduates for each of the twelve Secondary programs. Reported income is the sum of wages and salaries, interest and dividends, and other income (miscellaneous income from work provided by other than as employees) as reported to the Internal Revenue Service.

Table IIA-2, for example, provides the reported income of those who completed the Marketing Program. For the entire group of completers, the mean reported income in 1988 was \$11,770. Among the group, reported income varied as follows: 27.75% received less than \$5,500 (a mean of \$3,286); 8.32% between \$5,500 and \$6,999 (a mean of \$6,791); another 7.85% between \$7,000 and \$8,499 (a mean of \$8,395); 5.94% between \$8,500 and \$9,999 (a mean of \$9,761); 10.06% between \$10,000 and \$11,499 (a mean of \$10,790); 7.02% between \$11,500 and \$12,999 (a mean of \$12,579); 6.65% between \$13,000 and \$14,499 (a mean of \$14,194); 4.44% between \$14,500 and \$15,999 (a mean of \$15,485); 6.97% between \$16,000 and \$18,999 (a mean of \$18,586); 7.14% between \$19,000 and \$21,999 (a mean of \$21,694); 1.55% between \$22,000 and \$23,999 (a mean of \$23,496), and 6.31% had a reported income of at least \$24,000 with a mean of \$35,591.

The table also shows the distribution of the reported income among the 1984 Marketing completers who resided outside Ohio in 1988 as compared to those who resided in the state (a mean reported income of \$11,675 and \$11,791, respectively). The reported incomes of the Ohio residents are then shown by the region of their residence.

A tabulation of the mean reported income by program and region is given in Table IIA-13. Diagram IIA-A is a bar graph of mean reported incomes of completers of each of the twelve secondary vocational programs studied.

DIAGRAM IIA-A
1988 Mean Income of 1984 Secondary Vocational Graduates
by Program

B. GEOGRAPHIC MOBILITY OF 1984 SECONDARY VOCATIONAL GRADUATES

The mobility patterns of Secondary Vocational graduates can be analyzed by comparing their residence in 1988 to that of 1984, the year in which they completed their programs.

Each vocational graduate was identified by the zip code of the school attended in 1984. Using the geographical regional classification of the State based on zip codes, we were able to determine for each vocational program the number of graduates who resided in each of the five regions of the State of Ohio (Central, Northeast, Northwest, Southwest and Balance of Ohio) in 1988.

The group data on vocational graduates provided by the Internal Revenue Service for 1988 were classified by the same geographical regions within the State as well as a sixth region, out-of-state, for each of the vocational programs. We were thus able to trace the net mobility of the Secondary Vocational graduates between 1984 and 1988.

For each of the vocational programs, the State's retention rate was obtained by calculating the percentage of the total number of the 1984 graduates who in 1988 resided in any of the Ohio regions. Table IIB-1 shows the retention rate for each of the twelve Secondary Vocational programs as well as for all of these programs combined. The retention rate of all twelve Secondary programs is 87.01%, indicating that 12.99% of the 1984 graduates of these programs were out-of-state residents in 1988. The table also compares these retention rates to those for the 1983, 1982, 1981 and 1980 Secondary Vocational graduates in 1987, 1986, 1985 and 1984, respectively. Diagram IIB-A shows the retention rates for each of the five groups of vocational graduates.

It should be noted that net retention rates are calculated on the basis of residence. Therefore, retention by the State included those who resided in Ohio but worked out of state and did not include out-of-state residents whose work place was in Ohio.

TABLE IIB-1

**STATE RETENTION RATES OF 1984, 1983, 1982, 1981 AND 1980 SECONDARY VOCATIONAL GRADUATES
BY VOCATIONAL PROGRAM**

Four Years After Graduation
by Vocational Program

C. INCOME OF 1984 SECONDARY VOCATIONAL GRADUATES: COMPARISON WITH EQUIVALENT GROUPS

Income data on the 1984 graduates of secondary vocational programs for the 1988 Tax Year may be analyzed using baseline data on a comparable group, i.e., one with the same age bracket and educational achievement.

The U.S. Bureau of the Census data on 1988 money income of persons in the United States¹ can be used as a baseline with appropriate adjustments for the U.S. — Ohio and Ohio-regional income relatives. In 1988, earnings in the United States of males in the 18-24 age group with four years of high school education had a mean of \$10,956. The equivalent figure for females was \$7,600

In order to carry out the comparison between earnings of graduates of vocational programs in the study and those of the comparable group in the general population, the following procedures were utilized:

1. For each of the twelve secondary vocational programs, a U.S. basic comparison figure of earnings was calculated using the gender breakdown of graduates (See Table II-A) as weights. For example, the basic 1988 U.S. comparison figure of \$8,979 for graduates of Agricultural Production and Horticulture was calculated by multiplying 0.5918 (the proportion of females) times \$7,600 (the female earnings figure) and adding the result to that of multiplying 0.4082 (the proportion of males) times \$10,956 (the male earnings figure).
2. Bureau of the Census money income data for the applicable age groups and years of schooling are nationwide data. Therefore, in order to provide an appropriate comparison of money incomes of vocational graduates to earners in the general population within the State of Ohio and within the five regions of the State, the money income data by program and region were adjusted using income relatives between the U.S. and Ohio and between the U.S. and each of Ohio's five geographical regions. The income relative for each region was calculated using a

¹ U.S. Department of Commerce, Bureau of the Census, Current Population Survey, Unpublished Data (Income Statistics Branch).

population-weighted average of income relatives of component counties based on 1988 per capita income estimates for Ohio counties. Each 1988 mean reported income figure for the 1984 Secondary Vocational graduates included in the study (See Table IIA-13) was then divided by the ratio of the applicable income level for the region (or the State as a whole) to that of the U.S.

3. Each of these adjusted reported income figures for Secondary Vocational graduates was then divided by the 1988 money income applicable to the program as described in 1 above.

The results are shown in Table IIC-1. The ratios of the mean incomes in 1988 of the 1984 Secondary Vocational graduates to the 1988 incomes of the comparable group (the same age bracket, educational achievement and geographic region) are listed by vocational program and region. The Marketing Program can be used to illustrate the results. For all 1984 graduates of the program, the ratio of 1.37 indicates that the mean 1988 income was 37% higher than the 1988 mean income for the comparable group by age and educational achievement. For those completers of the program who resided outside Ohio, the ratio of 1.28 indicates they received a mean income 28% higher than the 1988 mean for the comparable group by age and educational achievement. For all 1984 graduates who lived in Ohio, the mean income was 38% higher than the comparable group in Ohio. The remaining ratios of 1.35, 1.23, 1.37, 1.25 and 1.63 indicate a higher percentage mean income of 35%, 23%, 37%, 25%, and 63% for those who resided in Central Ohio, Northeast Ohio, Northwest Ohio, Southwest Ohio, and Balance of Ohio, respectively.

D. INCOME OF 1984, 1983, 1982, 1981 AND 1980 SECONDARY VOCATIONAL GRADUATES FOUR YEARS FOLLOWING THEIR GRADUATION: A COMPARISON

The study has focused on 1988, which marks four years following the graduation of the 1984 Secondary Vocational graduates. The purpose of this section is to compare the mean incomes in 1988 of the 1984 vocational graduates with those of the 1983, 1982, 1981 and 1980 vocational graduates in 1987, 1986, 1985 and 1984, respectively. The five groups of vocational education graduates will be compared at the same point in their respective working paths, four years after their graduation.

Tables IID-1, IID-2, IID-3, IID-4 and IID-5 show the mean income by vocational program and region of 1984, 1983, 1982, 1981 and 1980 Secondary Vocational graduates in 1988, 1987, 1986, 1985 and 1984, respectively.

Table IID-6 and Diagram IID-A provide a comparison of the mean incomes of the five groups of vocational education graduates at the same point in their respective working path, four years after their vocational graduation.

1984 Vocational Education Graduates in 1988: A Study Based on Federal Income Tax Data
by I.A. Ghazalah, Ohio University

DIAGRAM IID-A
Mean Income of 1980, 1981, 1982, 1983 and 1984 Secondary Vocational Graduates
Four Years After Graduation
by Vocational Program

E. INCOME OF 1984, 1983, 1982, 1981 AND 1980 SECONDARY VOCATIONAL GRADUATES FOUR YEARS FOLLOWING GRADUATION: COMPARISON WITH EQUIVALENT GROUPS

A final comparison between the income performance of the 1984, 1983, 1982, 1981 and 1980 vocational graduates was conducted by reference to the comparable group in the general population.

Table IIE-1 shows the ratios of mean incomes in 1988 of the 1984 Secondary Vocational graduates to the 1988 mean incomes of the comparable group in the general population (the same age bracket, educational achievement and geographic region) by vocational program and region. Tables IIE-2 through IIE-5 show the equivalent ratios in 1987, 1986, 1985 and 1984 of the 1983, 1982, 1981 and 1980 Secondary Vocational graduates, respectively.

Table IIE-6 and Diagram IIE-A show the ratios of mean incomes of Secondary Vocational graduates (by program) to the mean incomes of comparable groups for the 1980-1984 completers. This provides a comparison of the ratios of mean incomes to the mean incomes of comparable groups at the same point in the career path of the five groups of vocational graduates, i.e., four years after completion of their programs.

VOCATIONAL EDUCATION
GRADUATES**

CHAPTER III

THE 1984 ASSOCIATE VOCATIONAL EDUCATION GRADUATES

The study utilized federal income tax records for the 1984 graduates of two Associate Vocational education programs or combinations of programs in the State of Ohio. In this chapter, we will report on and analyze the earnings and geographic mobility of the 1984 Associate Vocational graduates in 1988 four years following their graduation. The performance in 1988 of the 1984 Associate Vocational graduates will be compared with that of the 1983, 1982, 1981 and 1980 Associate Vocational graduates in 1987, 1986, 1985 and 1984, respectively.

Table III-A provides information on the 1,534 graduates of the two programs studied. It lists the programs, the number of graduates, and the percentage of females and males in each program. Table III-B presents the distribution of the 1984 Associate completers by vocational program and geographic training region.

A. INCOME OF 1984 ASSOCIATE VOCATIONAL GRADUATES: 1988 INCOME TABULATIONS

The data provided by Internal Revenue Service were used to determine the economic performance of the 1984 Associate Vocational graduates four years following their graduation.

Tables IIIA-1 and IIIA-2 present data on the 1988 Tax Year reported incomes of the 1984 Associate Vocational graduates for each of the two programs. Reported income is the sum of wages and salaries, income from interest, dividends and other income (miscellaneous income from work provided by other than as employees) as reported to the Internal Revenue Service. Table IIIA-2, for example, provides the reported income data of those who completed the Technical Education Program. For the entire group of graduates, the mean reported income in 1988 was \$22,598. Among the group, reported income varied as follows: 7.19% received less than \$5,500 (a mean of \$3,962); 1.48% between \$5,500 and \$6,999 (a mean of \$6,433); another 3.39% between \$7,000 and \$8,499 (a mean of \$8,250); 2.97% between \$8,500 and \$9,999 (a mean of \$9,872); 3.53% between \$10,000 and \$11,499 (a mean of \$11,497); 2.39% between \$11,500 and \$12,999 (a mean of \$12,267); 2.39% between \$13,000 and \$14,499 (a mean of \$12,267); 4.87% between \$14,500 and \$15,999 (a mean of \$15,285); 10.67% between \$16,000 and \$18,999 (a mean of \$17,974); 15.41% between \$19,000 and \$21,999 (a mean of \$21,456); 10.75% between \$22,000 and \$23,999 (a mean of \$23,532); and 34.96% had a reported income of at least \$24,000 with a mean of \$34,620.

The table also shows a distribution of reported income for those among the Associate graduates of 1984 who resided outside the State of Ohio in 1988 as compared to those who resided in the state (a mean income of \$25,248 and \$21,972 respectively). The reported incomes of the Ohio residents are then shown by the region of their residence (Central Ohio, Northeast Ohio, Northwest Ohio, Southwest Ohio and Balance of Ohio).

A tabulation of mean reported income by program and region is given in Table IIIA-3.

B. GEOGRAPHIC MOBILITY OF 1984 ASSOCIATE VOCATIONAL GRADUATES

The mobility patterns of Associate Vocational graduates can be analyzed by comparing their residence in 1988 to that of 1984, the year in which they completed their programs.

Each vocational graduate was identified by the zip code of the school attended in 1984. Using the geographical regional classification of the State based on zip codes, we were able to determine for each vocational program the number of graduates who resided in each of the five regions of the State of Ohio (Central, Northeast, Northwest, Southwest and Balance of Ohio).

The group data on vocational graduates provided by the Internal Revenue Service for 1988 were classified by the same geographical regions within the State as well as a sixth region, out of state, for each of the vocational programs. We were thus able to trace the net mobility of the Associate Vocational graduates between 1984 and 1988.

For each of the vocational programs, the state's retention rate was obtained by calculating the percentage of the total number of the 1984 graduates who in 1988 resided in any of the five Ohio regions. Table IIIB-1 shows the retention rate for each of the two associate vocational programs as well as for both programs combined. The retention rate of both associate programs is 84.05%, indicating that 15.95% of the 1984 graduates of both programs were out-of-state residents in 1988. The retention rate was 81.11% for Technical Education and 85.75% for Health Occupations Education. The retention rates for the 1983, 1982, 1981 and 1980 graduates are also shown for comparison. Diagram IIIB-A is a bar graph of the retention rates by program of the five chronological groups.

It should be noted that net retention rates are calculated on basis of residence. Therefore, retention by the State included those who resided in Ohio but worked out of state and did not include out-of-state residents whose work place was in Ohio.

C. INCOME OF 1984 ASSOCIATE VOCATIONAL GRADUATES: COMPARISON WITH EQUIVALENT GROUPS

The 1988 income data on the 1984 Associate Vocational graduates may be analyzed using baseline data on a comparable group, i.e., one with the same age bracket and educational achievement.

The U.S. Bureau of the Census data on 1988 money income of persons in the United States² can be used as a baseline with appropriate adjustments for the U.S.-Ohio and Ohio-regional income relatives. In 1988, earnings in the United States for those in the 25-34 age group with 1-3 years of college education³ was \$15,049 for females and \$23,132 for males.

In order to carry out the comparison between earnings of graduates of associate vocational programs in our study and those of the comparable group in the general population, we utilized the following procedure:

1. For each of the two Associate Vocational programs, a U.S. basic comparison figure of earnings was calculated using the gender breakdown of program completers (See Table III-A) as weights. For example, the basic 1988 U.S. figure of \$15,553 for Health Occupations Education was calculated by multiplying 0.9376 (the proportion of females) times 15,049 (the female earnings figure) and adding the result to that of multiplying 0.0624 (the proportion of males) times 23,132 (the male earnings figure).
2. Bureau of the Census money income data for the applicable age group and years of schooling are nationwide data. Therefore, in order to provide an appropriate comparison of money incomes of vocational graduates to earners in the general population within the State of Ohio and within the five regions of the State, the money income data by program and region were adjusted

² U.S. Department of Commerce, Economics and Statistics Administration, Bureau of the Census, Money Income of Households, Families, and Persons in the United States: 1988 and 1989, Series P-60, No. 17.

³ The median age of the 1984 associate degree graduates in Ohio was 30 years in 1988. This estimate was based on the Ohio Board of Regents' 1984 Student Inventory Data Enrollment in Ohio's Institutions of Higher Education: Two Year Centers.

using income relatives between the United States and Ohio, and between the United States and each of Ohio's five geographical regions. The income relative for each region was calculated using a population-weighted average of income relatives of component counties based on 1988 per capita income estimates for Ohio counties.

Each 1988 mean reported income figure for the 1984 Associate Vocational graduates (Table IIIA-3) was then divided by the applicable income ratio relative for the regions (or the State as a whole) to that of the U.S.

3. Each of these adjusted reported income figures was then divided by the 1988 mean income applicable to the program as described in 1 above.

The results are shown in Table IIIC-1. The ratios of the 1988 mean incomes of the 1984 Associate Vocational graduates to the 1988 mean incomes of the comparable group (the same age bracket, educational achievement and geographic region) are listed by vocational program and region. Diagram IIIC-A is a bar chart of the ratios of mean income of Associate Vocational graduates to mean general income.

D. INCOME OF 1984, 1983, 1982, 1981 AND 1980 ASSOCIATE VOCATIONAL GRADUATES FOUR YEARS FOLLOWING THEIR GRADUATION: A COMPARISON

The study has focused on 1988, which marks four years following the graduation of the 1984 Associate Vocational graduates. The purpose of this section is to compare the mean income in 1988 of the 1984 vocational graduates with those of the 1983, 1982, 1981 and 1980 vocational graduates in 1987, 1986, 1985 and 1984, respectively. The five groups of vocational education graduates will be compared at the same point in their respective working paths, four years after their graduation.

Table IIID-1 shows the mean income by vocational program and region of each of these five groups of Associate Vocational graduates.

1984 Vocational Education Graduates in 1988: A Study Based on Federal Income Tax Data
by I.A. Ghazalah, Ohio University

E. INCOME OF 1984, 1983, 1982, 1981 AND 1980 ASSOCIATE VOCATIONAL GRADUATES FOUR YEARS FOLLOWING THEIR GRADUATION: COMPARISON WITH EQUIVALENT GROUPS

A final comparison between the income performance of the 1984, 1983, 1982, 1981 and 1980 vocational graduates was conducted by reference to the comparable group in the general population.

Table IIIE-1 and Diagram IIIE-A show the ratios of mean incomes of Associate Vocational graduates by program and region to the mean incomes of comparable groups for the 1984, 1983, 1982 and 1981 and 1980 completers in 1988, 1987, 1986, 1985 and 1984, respectively. This provides a comparison of their ratios of mean incomes to the mean incomes of comparable groups at the same point in the career path of vocational graduates, i.e. four years after completion of their programs.

CHAPTER IV

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

CHAPTER IV

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

Vocational education, as all forms of education, has a multidimensional effect on the welfare of individuals and society. The economic performance of graduates of vocational programs is a primary factor in the evaluation of vocational education.

In its measurement of the economic performance of graduates of vocational programs, this study uses an original source of information — federal income tax records. The federal income tax source avoids a number of limitations associated with follow-up studies utilizing questionnaires. The tax records data are standardized by type of income and by period (tax year), and do not rely on the memory nor the selectivity of individual responses to questionnaires. The data were provided in batch form by the Internal Revenue Service from its Information Returns Master File in full compliance with the strict requirements regarding disclosure of personal information.

The economic performance of vocational graduates in 1984 is examined in 1988, four years following their graduation. The data on 22,091 graduates of twelve secondary and two associate vocational programs are categorized by the area of residence in 1988 — any of five regions in Ohio (Central, Northeast, Northwest, Southwest, and Balance of Ohio) and outside Ohio. The mean income of graduates of vocational programs four years following their graduation is compared to the mean income of equivalent groups in the general population (same age group, years of schooling and region of residence). The results indicate predominately higher incomes for graduates of all secondary and associate vocational programs in the study. The overall mean incomes of Secondary Vocational graduates are higher by 5 to 85 percent and those of Associate Vocational graduates by 12 and 68 percent. The higher percentage income also varies by region of residence in 1988.

The performance of the 1984 vocational graduates in 1988 was compared to that of the 1983, 1982, 1981 and 1980 vocational graduates (as reported in I.A. Ghazalah, 1983 Vocational Education Graduates in 1987, Ohio University, 1993; and 1982 Vocational Education Graduates in 1986, and 1981 Vocational Education Graduates in 1985, Ohio University, 1991 and 1989 Long Term Follow-up of Vocational Education Graduates, Ohio

University, 1989). The same data base, vocational programs and analytical techniques were used in studies of the five chronological groups of vocational graduates.

The mean income of Secondary Vocational graduates exceeds the mean income of the comparable group in the general population for each of the five chronological groups. The margin for the 1984 graduates ranged from 5% to 85%. For the 1983 graduates the margin ranged from 10% to 79% and for the 1982 graduates from 19% to 75%. For the 1981 graduates the range was from 20% to 82%, and for the 1980 graduates from 16% to 72%. In the Associate Vocational programs, the margins for Health Occupations graduates for 1984, 1983, 1982, 1981 and 1980 were 68%, 68%, 56%, 56% and 31%. The equivalent margins for Technical Education graduates were 12%, 11%, 18%, 10% and 5%.

The study also investigated the geographic mobility of vocational graduates between 1984, their year of program completion, and 1988. The mobility rates for graduates of all vocational programs combined and for graduates of each of the vocational programs indicate a high percent of vocational graduates remaining in the State, an overall percentage of 87.01% (with a range from 83.72% to 89.98% for individual programs) in Secondary programs and 84.05% in associate programs (85.75% for Health Occupations and 81.11% for Technical Education). For Secondary programs, the overall retention rates are higher for the 1984 than the 1983, 1982, 1981 and 1980 vocational graduates (87.01% compared to 85.42%, 84.46%, 83.22% and 82.50%). For Associate programs, the State retention rate for the 1984 graduates is 84.05% compared to 81.53%, 78.82%, 77.02% and 75.91% for graduates of the four previous years.

The results of examining the economic performance of the 1984 vocational graduates (by reference to the comparable group in the general population) and comparing these results to those obtained for 1983, 1982, 1981 and 1980 vocational graduates indicate consistent value of the vocational programs and suggest a general improvement in the performance of successive groups of vocational graduates.

The data and analyses of the data presented in this study show the value of utilizing federal income tax records as a source of information on the performance of graduates of vocational education programs. The rewards from obtaining reliable and consistent federal tax data point to the potential in the pursuit of information on the performance of vocational graduates.

Knowledge of the performance of vocational graduates as a whole, as well as graduates of specific programs, would contribute to effective decision making. Longitudinal studies of groups of vocational graduates would provide information on the nature and level of the impact of vocational education and the change over time in this impact.
